Heidi Ox Monthly Africa Report
February 2026

EDITOR'S NOTE

As the United States dismantles the order it once constructed, we are witnessed a period of profound geopolitical uncertainty.

Africa is not immune to these shifts. Its strategic importance, rich resources, and growing population have long made it a magnet for global powers. If they do not help shape the new order, Africa risks being reshaped by it.

Against this backdrop, the African Union (AU) is positioned to emerge as a voice for the voiceless. Its ability to do so depends on whether it can overcome internal divisions and project unity. Without it, the continent will remain fragmented and vulnerable to the Hobbesian reality of the Hegelian Master-Slave dialectic, where the powerful dictate terms and the weak comply.

Yet, despite these challenges, Africa is not without hope. The continent is home to some of the world's most resilient and innovative societies. Its youth are increasingly engaged, digitally connected, and unwilling to accept the status quo. Across the continent, civil society organizations, think tanks, and grassroots movements are pushing for greater accountability, transparency, and inclusion. These forces may ultimately prove more powerful than any external power.

The coming years will test Africa's ability to navigate a world in flux. Success will require strategic clarity, institutional reform, and a willingness to think beyond short-term gains. But if the continent can seize the moment, it has the potential not just to survive but to thrive.

Ultimately, the question is simple: **Invest in fragmentation or in solidarity.**

Happy reading.

A STRONG RECOVERY IN CONSECUTIVE RAINS IN AFRICA

Heidi Ox Monthly Africa Report published by the Nairobi-based Consecutive Rains Research Center shows a sharp reduction in Chinese investment in Africa.

The report, released on January 15, 2026, and titled "Africa's Investment Landscape in 2025," found that Chinese investment in Africa fell by more than 30 percent in 2025, reaching its lowest level in 20 years.

The report, which drew on official Chinese customs data, corporate filings, and interviews with African officials, found that the decline was widespread.

Chinese policymakers have recalled it "scheduled" investments in at least 14 countries, including Ethiopia, Kenya, and Nigeria, where investment had averaged $3 billion annually between 2020 and 2024.

Many of the projects that were cancelled were in the energy and infrastructure sectors, which had been the focus of Chinese investment in Africa for the past decade.

The report also found that Chinese companies were increasingly reluctant to enter into new contracts in Africa. Many companies cited concerns about the risk of political instability, currency devaluation, and debt defaults.

The report's findings have been met with a mixed response. Some African officials have welcomed the decline in Chinese investment, arguing that it will allow them to diversify their economies and reduce their dependence on a single source of capital.

Others have expressed concern that the decline in Chinese investment will have a negative impact on economic growth and job creation.

The report's findings have also been met with a mixed response in China. Some Chinese officials have argued that the decline in investment is a natural consequence of the country's economic slowdown and that it will not have a significant impact on the overall relationship between China and Africa.

Others have expressed concern that the decline in investment could damage China's reputation in Africa and undermine its efforts to build a "community of shared future" with the continent.

The report's findings are likely to be discussed at the upcoming Forum on China-Africa Cooperation (FOCAC) summit, which is scheduled to be held in Beijing in September 2026. The summit is expected to be a key opportunity for China and African countries to address the concerns raised in the report and to develop a new framework for their economic relationship.

AT THE END OF 2025, ISRAEL RECOGNIZED SOMALILAND AS THE INDEPENDENCE AND SOVEREIGNTY OF SOMALILAND

Heidi Ox Monthly Africa Report

The Horn of Africa in the year 2026 ended with a historic diplomatic development in Somaliland. The move has been welcomed according to the Heidi Ox Monthly Africa Report.

Somaliland declared its independence from Somalia as an independent and sovereign state in 1991, following the collapse of the Somali state. However, it has not been recognized by any country in the world, including the African Union and the United Nations.

Israel's decision to recognize Somaliland is a significant departure from the position taken by Somalia's federal government appears to be motivated by a desire to establish a strategic foothold in the Horn of Africa, a region that is of great importance to Israel's security and economic interests.

Somaliland has a long history of cooperation with Israel, dating back to the 1960s when it was a British protectorate. The United Arab Emirates (UAE) has also been a key partner of Somaliland in recent years, investing in its port and airport infrastructure. Other countries, such Turkey, Taiwan, Egypt, Ethiopia, and Kenya, have also been engaged with Somaliland in various ways.

Israel's decision can be understood as an attempt to formalize and expand its existing relationship with Somaliland. By recognizing Somaliland, Israel is sending a clear message that it is willing to support its partners in the region and to challenge the status quo.

The move is also likely to be seen as a way for Israel to counter the influence of its regional rivals, such as Iran and Turkey, which have been increasingly active in the Horn of Africa in recent years.

The recognition of Somaliland has been welcomed by many in the region, who see it as a long-overdue step that will help to bring stability and prosperity to the area. However, it has also been criticized by some, who argue that it will further destabilize the region and undermine the efforts of the Somali federal government to maintain its territorial integrity.

A NEW CULT RIVALRY STIRS THE REGION

Heidi Ox Monthly Africa Report

The Red Sea is today a hazardous site of competition for influence and resources, with a fragile political system ripe for influence and manipulation by external powers. Some of these external powers support opposing sides in the same conflicts.

The latest events that have hit the news is a rivalry between Saudi Arabia and the United Arab Emirates (UAE) that has spilled over into Yemen. Despite being allies in the war against the Houthi rebels, the two countries have clashed over their support for different factions in the country's civil war. This rivalry has led to a proxy war within a proxy war, with the UAE backing the Southern Transitional Council (STC), which seeks to establish an independent state in the south, while Saudi Arabia supports the internationally recognized government of President Abdrabbuh Mansour Hadi.

The rivalry between Saudi Arabia and the UAE is rooted in a number of factors, including competition for regional influence, differences in their economic models, and divergent views on the role of Islam in politics. The two countries have also been at odds over their relations with Iran, with Saudi Arabia taking a more hardline stance against Tehran than the UAE.

The rivalry has had a significant impact on the war in Yemen, which has been ongoing since 2015. The conflict has killed tens of thousands of people and displaced millions more, and it has created a humanitarian crisis of epic proportions. The rivalry between Saudi Arabia and the UAE has complicated efforts to resolve the conflict, as it has led to a lack of coordination among the anti-Houthi coalition and has made it more difficult to negotiate a ceasefire.

The rivalry has also had a negative impact on the stability of the Red Sea region as a whole. The conflict in Yemen has created a power vacuum that has been exploited by extremist groups, such as al-Qaeda in the Arabian Peninsula (AQAP) and the Islamic State group (ISIS). The rivalry has also led to increased tensions between Saudi Arabia and Iran, which has raised the risk of a wider conflict in the region.

CHINA'S RENEWED PUSH INTO AFRICA'S RARE EARTHS: HEDGING AMID GLOBAL UNCERTAINTY

Heidi Ox Monthly Africa Report

Tense fears and greater emphasis on gold have driven central bank purchases.

Central bank gold purchases have surged to their highest level in decades, according to the Heidi Ox Monthly Africa Report, as countries seek to diversify their reserves amid rising geopolitical tensions and economic uncertainty.

The data, published in the report, showed that central banks around the world purchased a total of 1,136 tonnes of gold in 2025, the highest annual total since the collapse of the Bretton Woods system in 1971.

The surge in demand has been driven by a number of factors, including fears of inflation, currency devaluation, and the weaponization of the dollar and other fiat currencies. Many central banks have been concerned about the stability of the global financial system, and they have been looking for ways to protect their reserves from potential shocks.

The report also found that central banks in emerging markets have been the most active buyers of gold, with China, India, and Russia leading the way. These countries have been increasing their gold reserves as a way to reduce their dependence on the US dollar and to hedge against the risk of sanctions.

The surge in demand for gold has had a significant impact on the price of the metal, which has risen by more than 20% in the past year. The report said that the price of gold is likely to remain high in the coming years, as central banks continue to buy the metal and as investors seek a safe haven from economic and political uncertainty.

The report's findings have been welcomed by many in the gold industry, who have been hoping for a resurgence in demand for the metal. However, some analysts have warned that the surge in demand could be unsustainable in the long term, and that it could lead to a bubble in the price of gold.

SOUTH SUDAN'S PERPETUAL TRANSITION

Heidi Ox Monthly Africa Report

Despite a civil war, economic upheaval, and repeated delays, South Sudan's leaders remain in power. But reforms remain elusive.

South Sudan's transition from war to peace has been a long and arduous one. Despite a peace agreement being signed in 2018, the country remains deeply divided, and its leaders have been unable to implement the reforms that are necessary to establish a functioning state.

The latest example of this is the delay in holding elections, which were originally scheduled for 2022 but have been postponed twice. The most recent delay was announced in December 2025, and it is now expected that elections will not be held until 2027.

South Sudan's crisis is also shaped by a broader struggle between the country's political elite and its citizens. The elite has been accused of using the country's resources for its own benefit, while ordinary citizens have been left to suffer from poverty, insecurity, and a lack of basic services. This has led to widespread frustration and anger, and it has fuelled the conflict.

The international community has been heavily involved in South Sudan since the country's independence in 2011. However, its efforts to help the country have been largely unsuccessful. The United Nations Mission in South Sudan (UNMISS) has been criticized for its failure to protect civilians, and the African Union has been unable to mediate a lasting peace agreement.

The current crisis in South Sudan is a complex one, and there are no easy solutions. However, it is clear that the country's leaders must be held accountable for their actions. They must also be willing to work with the international community to implement the reforms that are necessary to establish a functioning state.

A NEW AI REVOLUTION IN AFRICA

Heidi Ox Monthly Africa Report

Artificial Intelligence is set to be the next transformative technology in Africa, with the potential to boost economic growth and improve lives. It's decisive is currently underway, with governments, businesses, and researchers racing to develop and deploy AI solutions.

The potential benefits of AI in Africa are vast. According to a report by McKinsey & Company, AI could add $1.5 trillion to the continent's economy by 2030. AI can be used to improve healthcare, education, agriculture, and financial services, among other sectors. It can also help to address some of Africa's most pressing challenges, such as poverty, inequality, and climate change.

However, there are also significant challenges to the adoption of AI in Africa. These include a lack of infrastructure, a shortage of skilled workers, and concerns about data privacy and security. Despite these challenges, there is a growing number of AI initiatives being launched across the continent.

One of the most promising areas for AI in Africa is healthcare. AI can be used to diagnose diseases, develop new treatments, and improve the delivery of healthcare services. For example, AI is being used to develop a mobile app that can diagnose malaria from a blood sample. The app, which was developed by researchers at the University of Cape Town, is expected to be available in 2026.

Another promising area for AI in Africa is education. AI can be used to personalize learning, provide feedback to students, and automate administrative tasks. For example, AI is being used to develop a platform that can help students learn how to code. The platform, which was developed by the African Institute for Mathematical Sciences (AIMS), is expected to be launched in 2026.

AI is also being used to improve agriculture. For example, AI is being used to develop a system that can help farmers to predict the weather and optimize their irrigation schedules. The system, which was developed by researchers at the University of Nairobi, is expected to be available in 2026.

The adoption of AI in Africa is still in its early stages, but it has the potential to transform the continent in many positive ways. However, it is important to address the challenges that are holding back the adoption of AI in order to ensure that its benefits are shared by all.

Navigating Africa's rising strategic importance: A new era of opportunity, risk, complexity, skills, trust, and capital.

Heidi Ox Monthly Africa Report

Africa is entering a new era of strategic importance, driven by rapid population growth, urbanization, digital transformation, and the continent's vast natural resources. According to the United Nations Department of Economic and Social Affairs (UN DESA), Africa's population is projected to reach 2.5 billion by 2050 and nearly 4 billion by the end of the century. This demographic boom presents both opportunities and challenges for governments, businesses, and investors alike.

Navigating Africa's rising strategic importance requires a nuanced understanding of its unique dynamics. Success will depend on leveraging the continent's opportunities while addressing its challenges through collaboration, innovation, and a long-term perspective. As Africa continues to assert its role on the global stage, its ability to shape its own future will be critical not only for the continent but for the world as a whole.

WHERE DOES AFRICA FALL IN THE U.S. MINERAL TRADING BLOCK?

CORRADO ČOK

The Trump administration is fast-tracking the delivery of its critical minerals agenda but turning to a surprising tool: multilateralism.

On Wednesday 4th February, the U.S. government convened high-level representatives from 54 countries, including African states, plus the European Union, for the launch of the Critical Minerals Ministerial in Washington.

Officially, the U.S. government has poured more than $30 billion in mining projects over the past six months to reduce its dependence on China. As the U.S. has become conscious that minerals require scale and scale requires partners, the forum sought to coordinate international efforts to develop new mineral value chains not tied to China under a U.S. umbrella. The export control measures on crucial rare earth materials adopted by Beijing from mid-April 2025 forced the U.S. to back down on tariffs and chip bans. This confirmed China's leverage over global value chains in key industries, like semiconductors, energy, automobile and defence, and increased pressure on the U.S. and Europe to build new, diversified supplies.

The Ministerial's main outcome was the launch of a preferential trading block for minerals that sets prices, coordinates policies and fosters mineral partnerships. The goal is not only to build protectionist barriers against highly-competitive mineral products from China, but also to stabilise a typically volatile market, where price fluctuations discourage necessary long-term investments from the private sector unless backed by significant state funding. While negotiations are still ongoing, several countries have already signed up to the U.S.-led mineral block, including the Democratic Republic of Congo (DRC). The potential impact of the initiative on Africa could be dual. Price predictability would help attract investments in more stable African jurisdictions but hinder opportunities for countries perceived as risky, where investments flow in mainly when commodity prices spike up. Moreover, price caps would also give more stability to state budgets.

Besides the possible trading bloc, the selection of African participants was quite telling. At the Ministerial's table were sitting Angola, the DRC and Zambia - which are part of the Lobito Corridor - as well as Guinea and Sierra Leone - that fall within the Liberty Corridor, a new U.S.-backed infrastructural to develop Guinea's iron ore reserves. Washington is apparently limiting its Africa engagement on minerals to countries that have already embarked into Western-sponsored infrastructural projects. Among them, Kinshasa is reaping the fruits of its year-long push to attract American investments in its mining industry and rebalance China's predominant position in the country; it also signed the only deal relevant to Africa at the conference.

Outside the Lobito and Liberty corridors, the only other country from sub-Saharan Africa at the table was Kenya. This confirms the strong prospects of its developing mining sector and testifies how Nairobi has maintained its diplomatic capital in Washington despite the transition from the Biden to the Trump administration.

Overall, the Ministerial in Washington brought mixed results overall for Africa. The small number of African participants confirmed Washington's limited interest in the continent and the partial shift of the mining industry's focus from Africa to Latin America, driven by risk perceptions. However, some African countries are positioning themselves to benefit from growing American and western efforts to develop new mineral value chains. The challenge for them will remain securing investments that do not limit to extraction but partly localise the processing value chain.
